M-LAG allows two access switches in the same state to perform inter-device link aggregation negotiation with a user-side device or server, improving link reliability from the card level to the device level. Link aggregation has the following advantages:.. Link Aggregation is a technology defined in IEEE 802. 1AX) that allows multiple Ethernet interfaces to operate as a single logical link. It enhances bandwidth, provides fault tolerance, and allows load balancing between connected devices. After this lesson, you will be familiar with LAG commands of Huawei switches.
