ManageEngine OpManager is a comprehensive network switch or port monitoring software. With OpManager, you can monitor switch availability, health, and performance. OpManager's switch port monitoring functionality automatically discovers switches in your network and intuitively places them on a port view. Using OpManager's switch monitoring capabilities. With OpManager's network port monitor, you can create network maps in business views to graphically visualize your entire LAN. OpManager can automatically send alerts when a link goes down. OpManager's reporting functionality also provides you with a detailed availability report of your switches and switch ports. You can use these reports to ensure. OpManager comes with several performance monitors to keep the switches performance in check. With switch performance monitoring, you can monitor critical switch performance metrics such as IP routing discards, CPU cost rate, Total current buffer, jabber packets, undersize or oversize packets, drop events stats and more. Along with vendor monitors and. OpManager helps you monitor and troubleshoot network switch ports for traffic, utilization, errors and Service Level Agreement (SLA) verification. By presenting accurate information on port traffic and utilization, OpManager helps you identify top talkers on the LAN. 1. Monitor network port utilization and traffic with threshold alerts. 2. Detect p. Switches can have numerous interfaces, making switch monitoring difficult. OpManager comes with dedicated interface monitoring that discovers and monitors each and every interface present in the network switches. OpManager's interface monitors scrutinizes and features in and out speed of each interface. It also displays the availability status of int.

With online diagnostics, you can test and verify the hardware functionality of a device while the device is connected to a live network. Online diagnostics contains packet-switching tests
