

What is the acceptable milliwatt rating for an optical power meter

Preview

A typical OPM is linear from about 0 dBm (1 milli Watt) to about -50 dBm (10 nano Watt), although the display range may be larger. The "m" in dBm refers to the reference power which is 1 milliwatt. Instruments that measure in dB can be either optical power meters or optical loss test sets. An optical power meter (OPM) measures the power levels of light signals in devices that transmit data or power using light. The term "optical power meter" may sound generic, but in popular usage, it specifically implies a fiber optic power meter. Recommendation: Standard output for many optical transmitters.
