

What switch should be used for surveillance aggregation

Aggregation switches handle link aggregation by using LACP or Static Link Aggregation protocols. LACP is a dynamic protocol that automatically discovering and configures aggregated links between switches. This arrangement increases throughput beyond what a single relationship could sustain, offers redundancy in case one of the links. An aggregation switch is a network device that consolidates traffic from multiple access switches, wireless access points, or other edge devices and forwards it to core switches or routers. It facilitates the connectivity because it would rapidly become impractical to.
